Consent to vaccination

In this project we will develop a service where the school nurses can digitally obtain the consents that are now obtained through paper copies. The digital solution allows you to customize information, work with information in different languages etc. to provide information and prepare both students and parents for the vaccination. The consent will be signed by personal bank ID.

Actions and Objectives

Together with a team of IT-expertise and designers we will develop a new process for the errand. This will include an e-service as the interface for the users and an integrated and automated solution on the other side, where the officials take care of the results.
Rough sketch of the development process:
• RPA (Robot Process Automation) process design
• Robot development. Program the robot in development tools
• Perform controlled tests and test it within the production
• Continuous improvement. Analysis of deviations and development of corrective actions.

Expected Results

Expected results of the project:
More preventive and strenghtening initiatives for learning and health.
Increased availability and user friendliness.
Far more faster errand processes.
More thorough information about vaccination.
Increased focus on health actions towards the pupils.

Role of ERUDITE

ERUDITE has provided evaluation and progress through the SEROI+ method. This has been done through different steps. At first, a collecting phase was performed through open innovation. An analysing step was then done with mapping of the results from the process. The third and fourth steps are service design of the service and to implement and integrate the service into the systems.
